PAYMENT INTELLIGENCE

ALGO PAY

Payments,Engineered to Think.

AlgoPay operates through the Algomotive Enterprise Intelligence Layer, coordinating payment requests, supporting evidence, validation, financial controls, human authorization, controlled execution, reconciliation, exception handling, and transaction visibility across the existing ERP and connected financial systems.

- Purpose-built enterprise payment intelligence
- Payment validation with approved financial controls
- Human authorization before controlled execution
- Transaction-status visibility and reconciliation
- Works above and across the existing ERP without replacing it

---

Build Anything. Automate Everything. Scale Limitlessly.

PRODUCT OVERVIEW

Payment intelligence connected from request and validation to controlled execution and reconciliation.

AlgoPay operatesthroughthe Algomotive Enterprise Intelligence Layer, coordinatingpaymentrequests,supporting evidence, validation, financial controls, human authorization, controlled execution, reconciliation, exception handling, and transaction visibility across the existing ERP and connected financial systems.

01

Payment Validation

Check approved payment requests, beneficiary information, amounts, currencies, references, source documents, and supporting evidence.

02

Authorization Control

Apply approved roles, authority levels, segregation requirements, policies, workflow conditions, and human approval points.

03

Exception Intelligence

Surface duplicate requests, missing evidence, beneficiary differences, amount differences, policy exceptions, and unresolved transaction status.

04

Controlled Execution

Coordinate approved payment instructions through connected and authorized processes without creating uncontrolled autonomy.

05

Reconciliation

Compare approved instructions with transaction status, settlement information, accounting records, and operational evidence.

06

Observable Operations

Preserve request status, validation results, approvals, exceptions, execution events, reconciliation outcomes, and audit history.

GOVERNED WORKFLOW

Eight stages connect payment context, financial controls, human authorization, execution, and reconciliation.

Theworkflowisconfiguredaround theorganization's approvedpayment requests,supportingevidence, financial controls, authority limits, ERP and payment interfaces, users, execution boundaries, reconciliation requirements, and exception paths.

NO.	WORKFLOW STAGE	TECHNICAL DESCRIPTION
01	**Receive the Payment Request**	Bring approved payment requests and supporting information into a controlled workflow with clear ownership and status.
02	**Validate the Context**	Check beneficiary, amount, currency, due date, source documents, references, account information, and required supporting evidence.
03	**Apply Financial Controls**	Apply approved policies, duplicate checks, payment rules, authority limits, segregation requirements, and workflow conditions.
04	**Prepare Authorization**	Assemble the payment summary, evidence, validation results, exceptions, required approvals, and proposed next action.
05	**Preserve Human Authority**	Present the complete payment case to authorized people for approval, rejection, correction, escalation, or further investigation.
06	**Coordinate Controlled Execution**	Send approved instructions through the connected and authorized payment process while preserving execution boundaries and status.
07	**Reconcile the Result**	Compare approved instructions with transaction status, settlement information, accounting records, and relevant exceptions.
08	**Monitor and Improve**	Track agreed payment measures, exception patterns, authorization performance, reconciliation status, and control coverage.

EXCEPTIONS AND OUTCOMES

Focus authorized finance teams on payment cases requiring investigation, correction, approval, or escalation.

Representative exception scenarios

• Duplicate payment request	• Missing supporting evidence
• Beneficiary information difference	• Amount or currency difference
• Authority-limit exception	• Unapproved payment instruction
• Transaction-status mismatch	• Reconciliation difference
• Execution requiring escalation	

Implementation-specific outcome measures

• Payment-processing cycle time	• Authorization turnaround time
• Payment accuracy	• Exception volume
• Reconciliation completion	• Duplicate detection
• Control coverage	• Transaction visibility

EVIDENCE AND SCOPE

Workflow behavior, integration scope, payment channels, financial controls, authorization rules, execution boundaries, reconciliation requirements, processing capacity, and outcome targets are validated for each implementation. Published customer results will use approved and verifiable evidence.

Integrate with your business stack

TECHNICAL ARCHITECTURE

A modular operating foundation for payments, agents, controls, human authorization, ERP connectivity, and reconciliation.

LAYER	TECHNICAL RESPONSIBILITY
Experience	Payment workspace, request status, approval views, exception queues, reconciliation visibility, and operational reporting.
Agent and Workflow	Specialized agent roles, validation orchestration, financial controls, human authorization, execution coordination, and escalation.
Payment Context and Evidence	Approved payment requests, beneficiaries, amounts, currencies, references, invoices, supporting documents, transaction status, and settlement evidence.
Enterprise Intelligence Layer	Agentic AI and workflow orchestration operate above and across approved ERP, finance, payment, banking, document, data, and operational interfaces.
ERP and Connected Systems	The ERP and connected financial applications remain the systems of record. Approved instructions, accounting records, status updates, and reconciliation outcomes are synchronized through validated methods.
Governance and Operations	Identity, permissions, segregation requirements, authority limits, execution boundaries, monitoring, audit history, and outcome measures.

EVIDENCE AND SCOPE	AlgoPay extends the existing ERP and payment environment. The existing ERP and connected financial applications remain the systems of record. AlgoPay does not replace the ERP.

Implementation pathway

01	Qualify the payment workflow and define the business outcome	02	Map requests, evidence, controls, authority, systems, and ownership
03	Configure validation, agent roles, approvals, and exception handling	04	Connect approved ERP, finance, payment, banking, and data interfaces
05	Validate scenarios, controls, execution boundaries, and reconciliation	06	Enable finance users and complete controlled production readiness
07	Activate, monitor, measure, and continuously improve
